

Mini project 2

general tips

Are boundaries included in model?

Dirichlet method 1: $dcdt[0] = 0$ and $c0[0] = \text{boundary value at edge of domain (included by } dx/2)$

Dirichlet method 2: $dcdt[0] = D \frac{c_{left} - 2c[0] + c[1]}{dx^2}$ and $c0[0] = 0$. Boundary value 1 dx outside domain.

Method 2 is shifted 1 dx left compared to method 1

Which method gives the highest concentrations in the model domain??

Calculating total mass in system

This should give the same as: $\text{np.sum}(\text{O}_2[1:-2] * dx) + \text{np.sum}(\text{O}_2[0, -1] * dx/2)$

Output is O₂ mass unit / area unit.

If you want O₂ in the whole tank → multiply by the surface area of the tank

Does calculating total mass in domain verify that you have model conservation?

Calculate flux in and flux out of domain → does it equal the mass in the system?

Flux is instant at some x position [g/m²/s] $J_{in_cum} - J_{out_cum} = \text{accumulated in system without reaction}$
Cumulative flux unit = [mass/area].

Cumulative flux → integrate fluxes with respect to time → `np.trapz(fluxes, time)`

Handling 2 state variables

Flatten method was good for 2D arrays. It also works for 1D, but output is not that intuitive

The 2D case

Before flatten:

		→ r			
		0	1	2	3
↓ z	0	[0,0]	[0,1]	[0,2]	[0,3]
	1	[1,0]	[1,1]	[1,2]	[1,3]
	2	[2,0]	[2,1]	[2,2]	[2,3]
	3	[3,0]	[3,1]	[3,2]	[3,3]

After flatten:

r = 0	[0,0]	z = 0
	[0,1]	
	[0,2]	
	[0,3]	
r = 1	[1,0]	z = 1
	[1,1]	
	[1,2]	
	[1,3]	
r = 2	[2,0]	z = 2
	[2,1]	
	[2,2]	
	[2,3]	
r = 3	[3,0]	z = 3
	[3,1]	
	[3,2]	
	[3,3]	

The 1D case with two state vars

		→ State variables	
		0	1
↓ z	0	[0,0]	[0,1]
	1	[1,0]	[1,1]
	2	[2,0]	[2,1]
	3	[3,0]	[3,1]

State variable 1	[0,0]	z = 0
State variable 2	[0,1]	
State variable 1	[1,0]	z = 1
State variable 2	[1,1]	
State variable 1	[2,0]	z = 2
State variable 2	[2,1]	
State variable 1	[3,0]	z = 3
State variable 2	[3,1]	

Inspect and identify what rows and columns through the variable explorer to make sure you understand it.

Output from `solve_ivp()` gives time along the columns!

Alternative

See group exercise 6 solution under 09_23_sept

Use of np.concatenate()

O2 = np.zeros(len(x_grid)) = [0,0,0,0,0,0...]

OM = np.zeros(len(x_grid)) = [0,0,0,0,0,0...]

C0 = np.concatenate([O2, OM]) = [0,0,0,0,0,0...0,0,0,0,0,0...]

O2

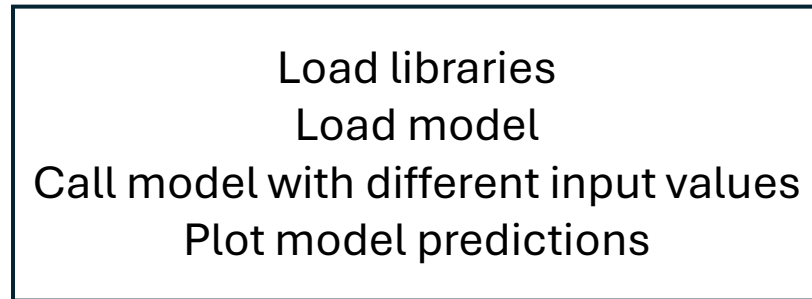

OM

Output from solve_ivp()

State variable 1	z = 0
State variable 1	z = 1
State variable 1	z = 2
State variable 1	z = 3
State variable 2	
State variable 2	
State variable 2	
State variable 2	

Modular approach

Script running model

Model()

Difficult to debug

Script approach

Script with model

Easy to debug
